Summary

Backend developer building distributed, AI-powered systems in Go, Python, and TypeScript. Completed Boot.dev's Backend Developer Path twice — once in Python/Go, once in TypeScript — with 2,700+ exercises and a top-250 global leaderboard rank. Two 24-hour AI-agent hackathons completed end to end. Currently architecting BlightSanest, a multi-service RAG platform designed for AWS.

Skills

- **Languages:** Go, Python, TypeScript, SQL, C
- **Backend:** gRPC, REST, FastAPI, Express, RabbitMQ (pub/sub), PostgreSQL (pgvector), Redis, ChromaDB
- **AI/ML:** RAG pipelines, hybrid search (BM25 + semantic, RRF), Sentence Transformers, CLIP, LLM integration (Gemini, Ollama, AWS Bedrock)
- **DevOps:** Docker, Kubernetes, GitHub Actions (CI/CD), AWS (S3, Aurora, EKS, Cognito), Linux, Git

Projects

BlightSanest — Stable Insights (in development) *Go, Python, gRPC, PostgreSQL/pgvector, Redis, S3, Docker, AWS*

Privacy-first smart journaling platform: users store personal data across any domain and query it conversationally through RAG or directly through hybrid search.

- Architected three services — Go API orchestrator, Python RAG engine, Go pub/sub — communicating over gRPC, with per-user isolated indexes for privacy by design.
- Implemented hybrid retrieval: BM25 and semantic embeddings (Sentence Transformers, pgvector) fused with Reciprocal Rank Fusion; Ollama for local LLM, AWS Bedrock in production.
- Built pre-computed indexing pipeline with S3 as source of truth, Redis hot cache with automatic fallback, MessagePack serialization, and Alembic schema migrations.
- RAG service phase complete; production design targets Aurora Serverless, EKS, and Cognito with a full Docker Compose local stack. [🔗 repo](#)

AI Damage-Claim Verification Agent

Python, CLIP, Ollama, Docker

24-hour hackathon (HackerRank Orchestrate, June 2026). Multimodal pipeline that decides whether submitted images support, contradict, or insufficiently evidence damage claims across cars, laptops, and packages.

- Combined CLIP (clip-ViT-L-14) image-text similarity for damage type, severity, and image-quality classification with a local Llama 3.2 model (Ollama) producing validated 14-field structured verdicts.
- Designed modular agent architecture (vision RAG layer → context organizer → LLM reasoner) with tunable evidence thresholds calibrated against labeled sample data. [🔗 repo](#)

Reargs Similarity API (live demo)

Python, FastAPI, ChromaDB, Sentence Transformers, Gemini

Semantic document-analysis API that detects patterns, redundancies, and similarities across uploaded documents (.txt, .md, .pdf).

- Automatic clustering via vector embeddings, natural-language querying of similar content, and LLM-powered generation from selected clusters.
- Deployed with a live public demo; GitHub Actions CI runs tests on every push; multi-stage Docker build. [🔗 repo](#)

Other projects: RAG support-ticket triage agent (24-hour hackathon, May 2026; Sentence Transformers + Gemini)

- Health-records RAG API (TypeScript, Express, openEHR/EHRbase, Ollama)
- Pub/sub financial-analysis CLI (Go, RabbitMQ, PostgreSQL) — all at github.com/mehmetcagriekici

Training & Certificates

Boot.dev Backend Developer Path — completed twice

2025 – 2026

Python/Go track (Dec 2025) and TypeScript track (Feb 2026): 30 courses and 12 guided projects covering distributed systems, HTTP servers/clients, pub/sub, RAG, Docker, Kubernetes, CI/CD, and cryptography. 2,723 lessons solved; top-250 leaderboard. Certificates verifiable at boot.dev/u/callsower.
